CAS INDEXING IS AVAILABLE FOR THIS PATENT.
AB The present invention relates to low turbidity microemulsions which contain reduced amounts of surfactants, i.e., emulsifying agents. Methods of making such microemulsions are also disclosed. The invention also provides for pharmaceutical or cosmetic formulations based on the microemulsions described herein, containing one or more pharmacological or cosmetic agents, and methods of using such formulations.

AB Emulsions of an aqueous or an aqueous-organic continuous phase and an organic discontinuous phase, the latter containing at least

a) a combination of active compounds tebuconazole and propiconazole

b) one phenol/styrene polyglycol ether of the formula (I) ##STR1##

where m=2.7 and n=2 to 13

c) and, if appropriate, an organic solvent which is not miscible with water,

wherein the combination of tebuconazole and propiconazole is dissolvable completely at 20.degree. C. in the a phenol/styrene polyglycol ether of the formula (I) or, optionally, together in (i) the phenol/styrene polyglycol ether of the-formula (I) and (ii) the organic solvent that is not miscible with water, at a content of more than 0.1% by weight, based on the total weight of the organic phase. Methods for making and using such emulsions.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.
AB The present invention relates to thermoplastic compositions which are degradable and/or compostable, the method of preparation of the degradable and/or compostable compositions and use of the degradable and/or compostable compositions in a monofilament, shaped article or film, or may be used as a coating, e.g., of paper, to achieve a stronger article. These compositions have the advantage over existing biodegradable and compostable compositions by exhibiting a higher dimensional stability and comparatively low cost.

L8 ANSWER 6 OF 77 CAPLUS COPYRIGHT 2003 ACS
ACCESSION NUMBER: 2002:737959 CAPLUS
DOCUMENT NUMBER: 137:385169
TITLE: Amphiphilic Hydrogels Constructed by Poly(ethylene glycol) and Shape-Persistent Dendritic Fragments
AUTHOR(S): Gitsov, Ivan; Zhu, Chao
CORPORATE SOURCE: Michael M. Szwarc Polymer Research Institute and Department of Chemistry, College of Environmental Science and Forestry, State University of New York, Syracuse, NY, 13210, USA
SOURCE: Macromolecules (2002), 35(22), 8418-8427
CODEN: MAMOBX; ISSN: 0024-9297
PUBLISHER: American Chemical Society
DOCUMENT TYPE: Journal
LANGUAGE: English
AB This paper describes the synthesis of amphiphilic hydrogels with highly shape persistent cross-link junctions using **linear blocks**, such as poly(ethylene glycol), PEG, and perfectly branched (dendritic) macromols. The synthetic strategy is based on the reaction of PEG with isocyanate or epoxy end groups as the hydrophilic component and hydrophobic dendritic poly(benzyl ethers) with amino groups at the periphery. It is found that the efficiency of the crosslinking reaction depends on the nature of chem. reaction used and the stoichiometric ratio of the two building blocks. The swelling of the gels formed is affected by the relative PEG content and by the polarity of the medium and the temp., and it varies between 1.2 and 16.7 (by wt.). The influence of various factors on the degree of crystallinity and phase segregation is also discussed.

AB A pharmaceutic composition includes a pharmaceutically acceptable carrier, comprising a reverse thermally viscosifying polymer. The polymer includes a **linear block copolymer**, wherein at least one block comprises a poloxamer; and at least one block comprises a biocompatible polymer or oligomer, in an aqueous medium. The composition also includes an active agent which imparts a pharmaceutic or cosmetic effect. The composition viscosities in response to an environmental stimulus. The composition is suitable for administration of the pharmaceutical agent across dermal, otic, rectal, vaginal, ophthalmic, esophageal and nasal mucosal membranes.

AB Synthetic polymer-based carrier vehicles for delivery of nucleic acid material to target cells in biological systems are made by self-assembly of the nucleic acid with cationic polymer material so as to condense the nucleic acid and form a polyelectrolyte complex and reacting the complex with hydrophilic polymer material which bonds to the complex forming a hydrophilic coating that stabilizes the complex and provides an outer protective steric shield. The carrier vehicles are useful for gene therapy.

AB A pharmaceutic compn. includes a pharmaceutically acceptable carrier, comprising a reverse thermally viscosifying polymer. The polymer includes a **linear block copolymer**, wherein at least one block comprises a poloxamer; and at least one block comprises a biocompatible polymer or oligomer, in an aq. medium. The compn. also includes an active agent which imparts a pharmaceutic or cosmetic effect. The compn. viscosifies in response to an environmental stimulus. The compn. is suitable for administration of the pharmaceutical agent across dermal, otic, rectal, vaginal, ophthalmic, esophageal and nasal mucosal membranes. E.g., a poloxamer was derivatized to obtain an acryloyl-terminated poloxamer and then this polymer was end-linked with poly(acrylic acid) by free radical polymn.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.
AB Disclosed are hair styling compositions comprising from about 0.01% to about 20% of a non-silicone-containing hair styling polymer; from about 0.1% to about 20% of a liquid hydrophilic non-polymeric cationic compound having at least one quaternary ammonium moiety; from about 3% to about 99% of selected carriers; and an organopolysiloxane microemulsion that contains a dispersing surfactant and from about 0.01% to about 10% organopolysiloxane (by weight of the composition), wherein the organopolysiloxane is substantially free of amino groups in combination with hydroxyl groups and the microemulsion has an average particle size of less than about 80 nm. The composition provides good style retention, restyling benefits, and improved hair aesthetics, e.g. blacker/shinier hair, less sticky/stiff.

AB Particles are provided that are not rapidly cleared from the blood stream by the macrophages of the reticuloendothelial system, and that can be modified to achieve variable release rates or to target specific cells or organs. The particles have a core of a multiblock **copolymer** formed by covalently linking a multifunctional compound with one or more hydrophobic polymers and one or more hydrophilic polymers, and contain a biologically active material. The terminal hydroxyl group of the poly(alkylene glycol) can be used to covalently attach onto the surface of the particles biologically active molecules, including antibodies targeted to specific cells or organs, or
molecules affecting the charge, lipophilicity or hydrophilicity of the particle. The surface of the particle can also be modified by attaching biodegradable polymers of the same structure as those forming the core of the particles. The typical size of the particles is between 180 nm and 10,000 nm, preferably between 180 nm and 240 nm, although microparticles can also be formed as described herein. The particles can
include magnetic particles or radiopaque materials for diagnostic imaging, biologically active molecules to be delivered to a site, or compounds for targeting the particles. The particles have a prolonged half-life in the blood compared to particles not containing poly(alkylene glycol) moieties on the surface.

AB Matrix-assisted laser desorption/ionization time-of-flight (MALDI-TOF) mass spectrometry was utilized to study simple poly(ethylene glycol)s (PEG) and a series of amphiphilic **copolymers** prepd. from PEG and dendritic mols. For the amphiphilic **copolymers** with branched dendritic structures, MALDI-TOF spectrometry affords more accurate mol. wt. data than the conventional GPC. For mass lower than 10 000, the mol. wt. distribution of the polymer is well-resolved into individual peaks. Using MALDI-TOF in the linear mode, **copolymers** with mol. masses of up to 43 000 Da were analyzed. For various dendrons attached to the same PEG, a good correlation was obsd. between calcd. and measured data for the expected incremental increase as a function of dendrimer generation. End-group anal. using MALDI-TOF mass spectrometry proved very useful for the anal. of polymers with relatively low mol. wts. The exptl.
results agree well with the calcd. masses of selected oligomers. Such end-group anal. can differentiate between the AB dendritic-linear diblocks, ABA triblocks, and linear PEG. These analyses support our earlier finding that the Williamson ether synthesis utilized in the PEG-dendron coupling reaction indeed converts all of the PEG to the desired block **copolymer** products.

ISSN: 0168-3659.
DOCUMENT TYPE: Article
LANGUAGE: English
SUMMARY LANGUAGE: English

AB Recombinant human erythropoietin (EPO) and fluorescein isothiocyanate labeled dextran (FITC-dextran) loaded microspheres were prepared by a modified W/O/W double-emulsion technique. Biodegradable linear ABA block **copolymers** consisting of poly(L-lactide-co-glycolide) A blocks attached to central poly(ethyleneoxide) (PEO) B blocks and star-branched AB block **copolymers** containing A blocks of poly(L-lactide) or poly(L-lactide-co-glycolide) and star-branched poly(ethyleneoxide) B blocks were investigated for their potential as sustained release drug delivery systems. Microsphere characteristics were strongly influenced by the polymer composition. In the case of the **linear block copolymers**, a reduced lactic acid content in a **linear block copolymer** yielded smaller particles, a lower encapsulation efficiency, and a higher initial drug release both in the case of EPO and FITC-dextran. The investigation of the effects of several manufacturing parameters on microsphere formation showed that the process temperature plays an important role. Microsphere formation in a +1degreeC environment resulted in higher drug loadings without increasing the amount of residual dichloromethane inside the particles. Other parameters such as the homogenization of the primary W/O emulsion and of the W/O/W double-emulsion have less impact on microsphere characteristics. Branched block **copolymers** containing star-shaped PEO also showed potential for the preparation of drug loaded microspheres. A certain amount of glycolic acid in the **copolymer** was necessary for the successful preparation of non-aggregating microspheres at room temperature. Again, the processing temperature strongly affected particle characteristics. Microsphere preparation at +1degreeC allows the formation of microspheres from a polymer not containing glycolic acid, a result which could not be achieved at room temperature. Moreover, compared to microsphere formation at room temperature, the effective FITC-dextran loading was increased. Concerning the EPO loaded microspheres, the amount of EPO aggregated was comparable to that using the linear ABA polymers. A continuous release of the protein from these star-shaped polymers could not be achieved. In conclusion, apart from microsphere preparation in a +1degreeC environment the choice of the polymer represents the main factor for a successful entrapment of proteins into biodegradable microspheres.

AB The invention provides dispersants and dispersant viscosity index improvers which include polymers of conjugated dienes which have been hydrogenated and functionalized. The dispersant substances include compositions including a **copolymer** of two different conjugated dienes, a **copolymer** of a p-alkylstyrene and a conjugated diene, or a homopolymer of a conjugated diene. The polymers are selectively hydrogenated to produce polymers which have highly controlled amounts of unsaturation, permitting highly selective functionalization. Also provided are lubricant fluids, such as mineral and synthetic oils, which have been modified in their dispersancy and/or viscometric properties by means of the dispersant substances of the invention. Also provided are methods of modifying the dispersancy and/or viscometric properties of lubricating fluids such as mineral and synthetic lubricating oils. The dispersant substances may also include a carrier fluid to provide dispersant concentrates.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.
AB A composition suitable for use in diagnostic imaging or as a cell killing agent comprising a chelating residue linked via an amide linkage to a poly(alkylene oxide) moiety, said composition having a molecular weight of at least 4,500; ##STR1## wherein: Z is a chelating residue;

Q is a divalent poly(alkylene oxidylene) moiety having a carbon terminus at R and at L;

L represents an amide linkage;

E.sup.(b) is one or more counterions each having a charge of b;

b is an integer from 1, 2 and 3;

n is an integer selected from the group 1, 2, 3 and 4;

w is zero or an integer from 1 to 5;

M.sup.(+a) is a cation, having a charge of +a;

a is an integer from 1 to 4;

r is 0 or an integer from 1 to 3, provided that when r is 2-3, each M.sup.(+a) can be the same or different cation;

d is the total charge on the chelating residue and is an integer from 0 to 10;

d+.SIGMA.(b.multidot.w)+.SIGMA.(a.multidot.r)=0; and

L8 ANSWER 26 OF 77 USPATFULL (Continued)

R is a capping moiety chosen from the group consisting of hydrogen, hydroxyl, C.sub.1 -C.sub.4 alkyl, aryl containing 6 to 24 carbon atoms, C.sub.2 -C.sub.5 alkanoyloxyl and C.sub.1 -C.sub.4 alkoxy, or R is an immunoreactive group or cytotoxic drug linked to Q by a chemical bond or a linking group.

AB Two series of hybrid linear-dendritic diblock **copolymers** were synthesized with the **linear block** being poly(ethylene oxide) and the dendritic block being poly(amidoamine) PAMAM. The aq. soln. behavior of the diblock **copolymers** was studied using intrinsic viscosity, gel permeation chromatog., and dynamic light scattering. The effect was detd. of the length of the poly(ethylene oxide) tail and the end group functionality of the dendritic block on the intrinsic viscosity of the **copolymer**.

AB Essentially linear synthetic (random or block) polyoxyalkylene lubricating oils, contg. <2 wt.% cyclic oligomeric byproducts and with mol. wt. distribution (Mw/Mn) of 1-2, are prepd. by polymn. or **copolymn.** in a homogeneous liq. phase in the presence of heteropoly acid catalysts. The monomers have the structures I and II [n = 1-8; R1-6 (which can be the same or different) are H, C1-20-alkyl, aryl, arylalkyl, and alkoxyalkyl]. The heteropoly acid catalysts are of general formula HxMyOz (M is selected from Group IB, IIB, IVA, IVB, VA, VB, VIA, and VIB elements; x = 1-7, yr .gtoreq.1, and z = 1-60), optionally contg. up to 30 mol water of hydration. Alcs., acyl-contg. compds., and alkalies can be used as end-caps to terminate polymn. or modify the properties of the polymer produced. The **block copolymers** have a high viscosity index (180-400), mol. wt. 250-10,000, and are compatible with mineral oil and synthetic hydrocarbon lubricants. Preferred co-monomers are THF, C2-20-monoepoxides, and oxetane; a preferred heteropoly acid is heteropolytungstic acid (H3PW12O40.10H2O).

AB The reactivity of benzylic dendritic polyethers toward linear polymers was investigated using coupling reactions of preformed dendritic and **linear blocks** in soln. and in the melt. The rate consts. for the Williamson reaction of polyethylene glycol (I) with dendritic bromides of various sizes increased with increasing length of the **linear block** and the generation no. of the dendrimer. This anomalous behavior was attributed to the increased reactivity of the I alcoholate anions due to the solvation of the counterion by the **linear block** and to the conformation changes occurring after attachment of the first dendritic block to I. The functional group of the dendrimer preserved its accessibility and reactivity even in highly restrictive medium and was able to participate in transesterification reactions with I in the melt. Thus, block **copolymers** that differed by a single linking bond between the linear and dendritic blocks were formed.

AB The emulsifying ability of polyoxyethylene-modified polydimethyl siloxane (POES) in silicone-water system was investigated. Nine kinds of POES were synthesized by addn. reaction of SiH and CH2:CH in the presence of the Pt catalyst. These were divided into 3 types: polyoxyethylene (A)-polydimethyl siloxane (B) **linear block copolymer**, A-B-A **linear block copolymer** and branched **copolymer** with side chain of A. The emulsifying ability of these POES was evaluated by observing the phys. appearance of the mixt. of each silicone and water with 4% of POES. Some of A-B and A-B-A linear **copolymer** showed higher emulsifying ability than the branched **copolymer**. These **copolymers** are considered as promising emulsifiers for silicone.

AB The present invention relates to an improved method for collecting blood. The present invention also relates to a method of collecting blood whereby tissue plasminogen, tissue plasminogen activator inhibitor and other serine proteases, serine protease inhibitors and components that are produced or destroyed through the action of serine proteases in collected blood are stabilized. In addition, the present invention provides a method for collecting blood that reduces the hemolysis (lysis of red blood cells). Using the blood collecting method of the present invention, reliable control plasmas can be manufactured.

AB A polymer article and a method for making the polymer article. The polymer article includes a hydrophobic polymer substrate and a block **copolymer**. The block **copolymer** has at least first and second blocks. The first block is more hydrophobic than the second block. The molecules of the block **copolymer** are secured into the surface of said substrate by means of the first block and at least a portion of the second block, outwardly extends from the surface of the substrate into the environment.

The method for making the polymer article, comprising a block **copolymer** and a hydrophobic substrate, comprises the steps of: (a) forming a solution of a block **copolymer** and a solvent which will solubilize said block **copolymer** and swell said substrate. The block **copolymer** has at least a first and second block. The first block is more hydrophobic than the second; (b) treating a hydrophobic substrate with the solution for a sufficient time to swell the substrate surface and enable at least a part of the more hydrophobic block to be deposited on the substrate; (c) removing block **copolymer** deposited substrate from the solvent; and, (d) placing block **copolymer** deposited substrate in water for a predetermined time until said block **copolymer** is oriented such that the more hydrophobic block is entrapped in the substrate and the less hydrophobic block is exposed to water.

AB Ceramic compositions comprising a ceramic material such as alumina, clay, a dispersant and a polymeric binder are prepared using as the polymeric binder a connected branch **copolymer** comprising a core segment, non-crosslinked branched polymer segments attached to the core segment and linear polymer segments connected to the branched polymer segments and bearing terminal groups capable of effecting hydrogen bonding. By using this form of polymeric binder, polymers of relatively high molecular weight can be used, thereby giving good green strength in the greenware, while still keeping the slurry viscosity relatively low.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.
AB Molding materials containing styrene-acrylonitrile **copolymers**, in which an additional essential ingredient is from 0.1 to 2.0% by weight, based on the **copolymer**, of a three-block polymer X-Y-X, where X is a terminal ethylene oxide block and Y is a central propylene oxide block. The proportion of terminal ethylene oxide blocks X, based on block **copolymer**, is from 5 to 20% by weight, while the central propylene oxide block Y has a number-average mean molecular weight of from 700 to 3,000 and its proportion is from 80 to 95% by weight, based on block **copolymer**. The number-average molecular weight of the sum of the two terminal blocks X is from 140 to 1,000.

The novel molding materials may be used for the manufacture of moldings, since the three-block **copolymer** X-Y-X advantageously influences the processing characteristics of styrene-acrylonitrile **copolymers**, and in particular broadens the range of conditions under which they may be injection-molded, without adversely affecting the mechanical properties of the styrene-acrylonitrile **copolymers**. Accordingly, the injection molding scrap rate can be kept very low.

AB Process for preparing linear terminally differentially electrophilically reactive prepolymers by reacting cyclic ethers or lactones comprising a major proportion of tetramethylene oxide with an initiator represented by the asymmetrical structure

YO.sub.m SO.sub.2 R.sub.n Q,

wherein

Q is a first radical which in anionic form is a non-terminating anion in the polymerization of tetramethylene oxide;

Y is a second radical, free from alkylatable groups, selected from alkyl, alkaryl, aryl, aralkyl and cycloalkyl and having the free valence on a carbon atom devoid of halogen atoms;

n = 0 or 1;

m = 0 or 1; and

R is a divalent bridging radical comprising at least one oxyalkylene radical --(OR').sub.q where q is 1 to 300 and preferably 1 to 50, and R' is alkylene of 2 to 10 carbon atoms, at least half being C.sub.4 H.sub.8.

The differentially electrophilically reactive prepolymers have different reactivity at the two ends so that successive reagents can react with the two ends to give product prepolymers having two unlike terminations. Such product prepolymers can provide segmented **copolymers** having utility as adhesives, elastomers and protective coatings.

PATENT INFORMATION:	US 4022941		19770510
APPLICATION INFO.:	US 1975-644831		19751229 (5)

RELATED APPLN. INFO.: Division of Ser. No. US 1974-483660, filed on 27 Jun 1974, now patented, Pat. No. US 3947386 which is a division of Ser. No. US 1971-212729, filed on 27 Dec 1971, now patented, Pat. No. US 3836560 which is a continuation-in-part of Ser. No. US 1971-122164, filed on 8 Mar 1971, now abandoned
DOCUMENT TYPE: Utility
FILE SEGMENT: Granted
PRIMARY EXAMINER: Cockeram, H.S.
LEGAL REPRESENTATIVE: Finnegan, Reynold J.
NUMBER OF CLAIMS: 17
EXEMPLARY CLAIM: 1,16
LINE COUNT: 1854
CAS INDEXING IS AVAILABLE FOR THIS PATENT.
AB Linear siloxane-polyoxyalkylene (AB).sub.n block **copolymers** having an average molecular weight of at least about 30,000, compositions of polyurethane-forming froths containing said **copolymers**, the curable froths produced from said compositions, methods for utilizing said froths as well as the cured foams and articles produced therefrom, said froths having utility in the production of molded polyurethane foam articles, foam backings for carpeting and fabrics, coatings for wire, cable and other articles, small cavity encapsulations, and the like.

L8 ANSWER 76 OF 77 USPATFULL
ACCESSION NUMBER: 77:23825 USPATFULL
TITLE: Process for preparing shaped, foamed polyurethane articles
INVENTOR(S): Prokai, Bela, Mahopac, NY, United States
Kanner, Bernard, West Nyack, NY, United States
PATENT ASSIGNEE(S): Union Carbide Corporation, New York, NY, United States (U.S. corporation)

AB A **copolymeric** material is provided in accordance with this invention which is the reaction product of a di (omega-thio-organo) dimethyl siloxane oligomer having terminal active hydrogen groups and a difunctional organic compound having terminal isocyanate groups. The siloxane-thiourethane **copolymer** provides good release per se from tacky adhesive masses or when combined with other film formers.
